

SYSTEM AND METHOD FOR PACKAGING COFFEE OR TEA

Abstract of the Disclosure

A package for packaging coffee or tea particulate includes (a) a pouch filled with
5 particulate; and (b) a two-piece, pressurizable can comprised of a first, cup-shaped
portion having an opening, and a second disk-shaped piece for covering the opening. The
pouch is packaged inside the cup-shaped portion and sealed therein by the second disk-
shaped portion so as to contain the pouch. Optionally, the particulate is sealed in a CO₂
environment under pressures exceeding ambient pressure. Optionally, several of such
10 packages are packaged together in a multipurpose sleeve. The invention permits the
flavor of the particulate to be dispensed discretely as consumed, thus preserving the flavor
for a long as possible.
